*Support for two devices per port—Cisco IP telephony allows the
same access switch port to provide network access to an IP phone
and a data device connected on the Ethernet port behind the
phone. The phone can only send tagged traffic on the voice VLAN
and the PC can only send untagged traffic on the data VLAN. This
is done to cut down on cabling, capital equipment, and
administrative costs ...*

[Radar – O'Reilly](#)

If you have implemented IP telephony, IP phones are capable of tagging their own traffic through an integrated two-port switch. A switch does not expect to see traffic with VLAN tags on ports in Access mode because most devices on those ports do not tag their own traffic; traffic on Trunk mode ports automatically allow traffic tagged for any VLANs to be sent to connected switches.
